

## JIE R&R of SOP\_Repeated

- Take out renegotiation
  - Add more basic tradeoff
  - (??) Draw inverted U for lobby
  - Now my short punishments don't rest on renegotiation
    - \* So now, for main analysis, must assume that we're constraining attention to a certain class of punishments: symmetric, and "Punish for  $T$  periods then go back to cooperation"
    - Go back to start if deviate should work for governments, but I think I need something else for lobbies since they would like that
    - \* Can I show that mine are optimal in this class?
    - \* Will look at asymmetric punishments in later section
- New section on asymmetric punishments (addresses, in part, Giovanni's #7)
  - Constrain to  $T$ -period class, now asymmetric—punish deviator more
  - There is literature on this
  - In this setting, can you achieve lower  $\tau^A$  with asymmetric?
  - Have to check lobby conditions
    - \*
    - \* Do they change over the course of the punishment?
      - Joel thinks they'll be tightest at beginning of punishment phase
    - \* How asymmetric can they get?
      - Is it hard to make punishment really asymmetric b/c of presence of lobby?
      - If so, this puts some constraint on asymmetry of punishment
- #2 is not what I thought it was
  - Giovanni's concern: when determining  $\bar{e}$ , I need to take into account that  $\tau^b$  depends on  $\bar{e}$ 
    - \* I'm almost certain that I do this, but I'm also sure now that I don't explain it at all in the text
    - \* It is true that the severity of the punishment for deviating does not depend on  $\tau^b$ , and that this means that  $\tau^b$  will maximize current payoff (actually, continuation value?). So clearly  $\tau^b$  is a function of  $e^b$

- Sweep through to make sure all analysis takes account of this concern
  - \* Jan. 17: Decided I need to hold off until I reformulate since I don't have much in the text; I'm going to have to add more.
- Maybe need to change notation on  $\tau^B(\gamma(e))$  to be clear
- Need to explain mechanics of  $\bar{e}(\tau^B)$  relationship MUCH better
  - \* End of first para. of section 3.2
  - \* Paragraph following equation eq:lobtw; also above this paragraph (top of pg. 9)
    - Technical part of 3rd condition needs to be re-stated
    - Whole passage needs to be re-stated. At least some of the conditions are just what needs to be true for something to be a break tariff. What of this am I assuming? What can I show is a result of lobbying/legislature behavior?
  - \* Possibly just before start of section sec:structure
- email Giovanni
  - How to satisfy an author who thinks the results are not “particularly interesting or surprising” and has not given a clear indication of what it is he wants
  - Should I try going to linear supply/demand system?
  - thank him
  - “I want to be very clear that I understand that my previous discussion did not make clear [sic]”
  - “I just want to know if this is along the right lines”

#### Smaller points

- Reviewer 1, #2 goes away with renegotiation
- Need thorough lit review of finite punishments
  - Green Porter in game theory
  - Is there anything in trade?
